

Ejercicio I

Linear regression

Specifications

- Using *dataset_ejercicio_1_regression_lineal.csv* dataset do the following:
 - Load the specified dataset
 - Column *size* is the feature of each house
 - Column *price* is the target value to predict
 - Create a new dataset with 90% of data for training and 10% for testing (set *random_state=0*)

Specifications

- Using the train set:
 - Try different values of parameters *iterations* and *alpha* (learning rate)
 - Use gradient descent algorithm to create a line that fits the best
- Using test set:
 - Predict values of the test instances
 - Measure mse

Evidences

- Load to TEAMS platform:
 - The source code
 - The graphic of the best line generated for the training set
 - The graphic of the line generated for the test set
 - The mse value of training set and the test set
